

Abrasion resistance improvement : High-Performance additives for a sustainable world

Whether it is WB, SB, UV crosslinking, 1K, 2K, acrylic, PE, PU, or other, abrasion resistance is always one of the essential properties of your coating. A coating that resists to abrasion also lasts longer, contributing to a more sustainable world.

Arkema, as a key raw material supplier, participates in your formulation development. This presentation will focus on its high-performance additives, particularly for improving abrasion resistance in coating.
