BYK-AQUAGEL® 7100 - a new clay technology for excellent system stability and simple handling

The new rheology modifier BYK-AQUAGEL 7100 offers a good balance of ease of use and targeted effect. Whether for stabilizing pigments, fillers or coarse sands in plasters. With our new layered silicate you can achieve excellent stability of water-based paints, lacquers and plasters. In addition, you can effectively reduce the tendency of matting agents to settle in transparent systems. Due to the internal lubrication effect of BYK-AQUAGEL 7100 a smooth processing is ensured. The loose structure of this new clay enables a quick viscosity build up and less post thickening effect.
