

Laurent Barnils - Global Product Manager Rheology Modifiers

## Rheology Modifiers

Why should you choose between natural and synthetic rheology modifiers? We present sustainable solutions obtained from both natural and synthetic origin

Our complete rheological additives portfolio will be presented including our ranges of:

- Natural based technology polymer, ESACOL ED MAX, which provide high stability and anti-spattering properties to paints
- Associative biobased polyurethanes, VISCOLAM BIO PS, which have different rheology profiles developed for multiple coating applications.

We are rethinking our synthetic polymers structure using biobased raw materials to allow formulators to easily upgrade their formulas technically and sustainably!
