**The art of correction – BYK-3938 P®**

There are new challenges every day in the production of coatings. They cause the need for corrections in the complex multicomponent system paint. The improvement of one aspect often creates an issue with a different property. Until now, the correction options for finished powder coatings were very limited. Most material that deviated from specification had to be reworked in the manufacturing process, even if the gloss was only a few units too high.

BYK-3938 P makes it possible for the first time to apply the art of gloss correction in powder coatings - from adjusting some gloss units to changing from glossy to matte finish. Learn about the aspects to consider when correcting powder coatings and how BYK-3938 P supports your material stay within specifications.
